

本人的 task 完成的是 python 语言的学习，完成了基础实验路径 Python Bootcamp

```
1 # TODO: slice the first three elements of list 'y' and
2 # store in a new list, then print the 2nd element of this
3 # new list
4 y = ["Robots are c"] + [0, 0, 1]
5 new_list = y[0:3]
6 print(new_list)
7 print(new_list[1])
8
```

✓ [3] 81毫秒

['Robots are c', 0, 0]

0

此为 python 学习中的 list 学习部分

```
1 robots = ['baxter', 'sawyer', 'turtlebot']
2
3 # TODO: Using a for loop and the python built-in enumerate function,
4 # Print "#1: baxter", "#2: sawyer", "#3: turtlebot",
5 # each on its own line
6 for i,robot in enumerate(robots,start=1):
7     print("#",i,":",robot)
8
```

[2]

# 1 : baxter

# 2 : sawyer

# 3 : turtlebot

此为 loop 学习部分

```
1 import numpy as np
2 A = np.array([[5, 6, 8], [2, 4, 5], [3, 1, 10]])
3 B = np.array([[3, 5, 0], [3, 1, 1]])
4 # TODO: multiply matrix A with matrix B padded with 1's to the
5 # same dimensions as A; sum this result with the identity matrix
6 # (you may find np.concatenate, np.vstack, np.hstack, or np.eye useful).
7 # Make sure you don't alter the original contents of B. Print the result
8 BB = np.copy(B)
9 b = np.array ([1,1,1])
10 bb = np.vstack((BB,b))
11 print(bb)
12 result1 = np.dot(A,bb)
13 print(result1)
14 C = np.eye(3)
15 result = result1 + C
16
17
18
```

[8]

[[3 5 0]

[3 1 1]

[1 1 1]]

[[41 39 14]

[23 19 9]

[22 26 11]]

此为 numpy arrays 的学习部分，学习矩阵运算，将 B 补齐到与 A 同维后，A 和 bb 矩阵相乘

```
1 # TODO: print every other integer from 0 ... 6 multiplied by 2
2 # as a list
3 import numpy as np
4 A = np.arange(0,7)
5 print(A)
6 print(A*2)
7
```

```
[14]
[0 1 2 3 4 5 6]
[ 0  2  4  6  8 10 12]
```

学习矩阵中的运算
